ABSTRACT

A technical installation is planned using a computer-supported project planning tool, by interactively specifying a number of descriptions of technical elements and by describing their topology. For this purpose, a user either selects, from at least one catalogue of predefined, unchangeable standard description of elements, of which descriptions and a priority number is assigned, or specifies a different description of the project planning tool. The planned installation is assigned this priority number by the project planning tool only if such standard descriptions are specified.
